Biomass / Renewable Energy

The district heating concept changed in the early 80's to include small scale renewable energy schemes. In country's across Europe where there were large natural resources like wood, farmers became energy suppliers and built up small district heating networks for their villages. These small schemes and local farmers now benefit from growth in the use of energy crops such as coppice.

Flexenergy's pre insulated pipes are ideally suited to renewable energy projects, offering an easily installed, flexible, fully welded pipe system

Biomass Crops

Biomass Pellets

Biomass Boiler
